

The last question can the two subnets ping each other :

Make 192.168.2.* Accessible from 192.168.1.*

Now we need to add a routing entry such that we are able to ping 192.168.2. series ip-addresses from 192.168.1. series. The common point we have is the GATEWAY machine. So, on each machine in 192.168.1.* network a default gateway will be added as shown below.

```
route add default gw 192.168.1.2
```

Now when 192.168.1.5 pings 192.168.2.7, it will go to the GATEWAY via 192.168.1.2.

In GATEWAY, add the following routing entry.

```
route add -net 192.168.2.0 netmask 255.255.255.0 gw 192.168.2.2
```

Now all the packets addressed to 192.168.2.* network will be forwarded via the 192.168.2.2 interface, which then delivers the packets to the addressed machine.

Make 192.168.1.* Accessible from 192.168.2.*

It is very similar to what we did earlier.

So, on each machine in 192.168.2.* network a default gateway will be added as shown below.

```
route add default gw 192.168.2.2
```

In GATEWAY, add the following routing entry.

```
route add -net 192.168.1.0 netmask 255.255.255.0 gw 192.168.1.2
```

Now 192.168.2.* machines can ping 192.168.1.* machines.
